RubiKon

A new sub chassis for the Linn Sondek LP12 by AudioFlat

RubiKon n - (rū'bīkōn) 'a line that when crossed permits no return and typically results in irrevocable commitment'

The RubiKon is a new sub-chassis for the Linn Sondek LP12. Born out of an idea over a pint in a pub (!) it is designed from first principals to be the best sub-chassis we could produce within the physical requirements of an LP12.

It uses constrained layer damping and separate structures for the arm and bearing mounts. The construction method controls the resonant frequency of the various sections allowing energy to be dissipated into the sub-chassis away from the stylus contact point. The bearing mount is even thicker than that on the Linn 'Cirkus' sub-chassis allowing a stronger connection between bearing and sub chassis.

The various parts are CNC cut from 6082T6 grade aluminium which has excellent machining properties. The finished parts are hard satin black anodised, after being 'finished', to provide an immaculate fit and finish. The sub-chassis and armboard sections are glued together individually; the whole structure is then bolted together using stainless steel bolts to provide a rigid connection between sub-chassis and armboard.

The RubiKon will be available with a standard Linn and NAIM Aro mount at launch; other mounts can be catered for. The armboard can be changed by your dealer allowing one to upgrade the tonearm on your LP12 without buying a whole new sub chassis. It will be sold through a selected number of retailers.

Improvements over a standard Linn pressed steel sub-chassis include better detail retrieval, improved bass timbre and definition, larger soundstage and an overall cohesiveness throughout the entire audio spectrum. Music is replayed with the macro and micro dynamics intact. Loud instruments are layered over the top of the tiniest detail without smothering them.

The 'tune' is simply easier to follow!
